

Beyond FX, Stocks & Crypto APIs & Data Feeds for Alternative Assets

Prediction markets, private equity, collectibles, wine, watches, farmland, royalties, and other corners of the investable universe — what's actually buildable vs. what's just a platform to watch

Prepared for: platform development / discovery phase — alt-data
extension module

Date: 29 July 2026

Scope: prediction markets, sports exchanges, pre-IPO/private equity,
collectibles, wine & whisky, classic cars & watches, real
estate/farmland indices, music royalties, carbon credits, domain
names

Note: research reference only, not investment or legal advice.

Several of these markets are unregulated or lightly regulated —
verify current legal status in your jurisdiction before building
anything transactional.

Contents

REAL API a genuine, documented programmatic interface exists **PARTIAL / UNOFFICIAL** data is accessible but via scrapers, wrappers, or members-only access
NO API platform only — nothing to integrate, just a product to study or use directly

1	Prediction Markets & Event Contracts
2	Sports Trading Exchanges
3	Pre-IPO / Private Company Markets
4	Sneakers & Streetwear Resale
5	Trading Cards & Sports Memorabilia
6	Fine Wine & Whisky
7	Classic Cars & Watches
8	Real Estate, Farmland & Timber Indices
9	Music & Royalty Income
10	Carbon Credits & Environmental Markets
11	Domain Names
12	Fractional Collectibles Platforms (context only)
13	Reality Check: What's Actually Buildable
14	Suggested Alt-Data Module Architecture

1. Prediction Markets & Event Contracts

Trade yes/no contracts on real-world outcomes — elections, Fed decisions, weather, sports, pop culture. This is the most API-mature category in this whole document.

PLATFORM	WHAT IT GIVES YOU	API ACCESS	NOTES
Kalshi docs.kalshi.com	CFTC-regulated event contracts (elections, economics, weather). REST API: /markets, /events, /orders, /portfolio. All market data (prices, order books, history) is public and unauthenticated; trading requires API-key + RSA-PSS auth.	REAL API	The first CFTC-regulated prediction market exchange — cleanest single-API architecture of the category. No official SDK, but the REST design is simple enough that you don't need one.
Polymarket clob.polymarket.com	The volume leader. Central Limit Order Book (CLOB) API for events/markets/order books/trade history; built on Polygon, so all on-chain activity is publicly queryable too. Free for reading; trading needs a wallet + EIP-712 signing.	REAL API	Public read endpoints need no auth. Recently acquired QCEX to re-enter the US market as a CFTC-regulated exchange under "Polymarket US."
Novig / Sporttrade (sports-specific)	Peer-to-peer sports trading exchanges — order-book pricing instead of sportsbook odds	NO API	See Section 2 — these are consumer trading apps, not data providers.
Limitless / Opinion / Manifold (smaller platforms)	Limitless (Base chain, fast-settling crypto/macro markets, REST+WebSocket); Opinion (BNB Chain, CLOB + Python SDK); Manifold (play-money, fully open API — great for prototyping without real funds)	REAL API	Manifold in particular is worth knowing about purely as a free sandbox to build and test your prediction-market ingestion logic before touching real-money platforms.
Unified aggregators: PMXT, Tatum, FinFeedAPI, PolyRouter, Prediction Hunt v2	One schema/one API key across Polymarket + Kalshi (+ others). PMXT is an open-source Python/TypeScript SDK; Tatum and FinFeedAPI are commercial single-endpoint wrappers.	REAL API	Worth using instead of integrating Polymarket and Kalshi separately — they use genuinely different auth models (blockchain wallet vs. traditional API key), so a normalizer saves real engineering time.

Regulatory status is actively contested. As of July 2026, Kalshi faces active litigation or enforcement in over a dozen states (injunctions in Nevada, Michigan, Massachusetts among them), while the CFTC is simultaneously suing several states to block their enforcement, arguing federal preemption. Polymarket's US arm faces a narrower but real dispute in Nevada. If a prediction-markets module becomes part of your platform, this is the single fastest-moving legal picture in the entire document — check current state-by-state status immediately before launch, not just at design time.

2. Sports Trading Exchanges

The "exchange" model applied specifically to sports betting — you trade against other users via an order book instead of betting against the house.

PLATFORM	WHAT IT IS	API ACCESS	NOTES
Novig	Commission-free peer-to-peer sports exchange; just won CFTC Designated Contract Market approval (fastest in CFTC history) via its Ludlow Exchange LLC entity, giving it a federal route around state-by-state sportsbook licensing	NO API	\$75M Series B (Feb 2026, led by Pantera Capital) at a \$500M valuation; annualized volume over \$4B
Sporttrade	One of the original "sports stock market" exchanges — recently shut down its traditional sportsbook operations in five states to pivot fully into becoming a CFTC-regulated DCM/DCO, following Kalshi's and Novig's playbook	NO API	2% commission model historically, moving toward the federal exchange structure
DraftKings DKeX / FanDuel-CME partnership	Incumbent sportsbooks building their own CFTC-regulated event-contract exchanges rather than ceding the category to Kalshi/Novig	NO API	Signals this exchange model is becoming the industry standard, not just a startup niche

None of these publish a public data API today — they're consumer trading products, not data providers. If you want programmatic sports-event pricing, Kalshi and Polymarket (Section 1) already carry plenty of sports contracts and do have real APIs; that's the more practical integration path right now.

3. Pre-IPO / Private Company Markets

Buying stakes in companies before they list — OpenAI, Anthropic, SpaceX, Stripe-type names. This category actually has genuine institutional-grade pricing data, even though the marketplaces themselves are closed shops.

PLATFORM	WHAT IT GIVES YOU	API ACCESS	NOTES
Forge Data / Forge Price™ forageglobal.com/forge-data	A proprietary daily indicative price for ~200 pre-IPO companies, built from primary funding rounds + secondary transaction data + indications of interest. The Forge Data API delivers same-day trade pricing, valuations, and historicals; file-based delivery also available. Powers the Forge Private Market Index and Forge Accuidity Index.	REAL API	This is the closest thing to a "Bloomberg for private companies" — genuinely the best data layer in this entire category. Forge itself was just acquired by Charles Schwab.
Caplight MarketPrice™ caplight.com	Institutional-quality daily secondary-market pricing for actively traded VC-backed private companies, built from funding rounds, trade data, and order data — designed to be predictive of upcoming secondary trades, rounds, or IPO pricing	REAL API	Forge Data's main direct competitor in the "private-market pricing feed" space
EquityZen / Hiive / Nasdaq Private Market	The actual transaction marketplaces where accredited investors buy/sell private shares	NO API	Products to route trades through once you have pricing data, not sources of data themselves
SEC EDGAR (Form D, S-1 filings)	Free source-of-truth for private placement filings and IPO registration statements once a company gets close to the public markets — covered in depth in the first resource PDF	REAL API	Complements Forge/Caplight pricing with the regulatory paper trail

4. Sneakers & Streetwear Resale

A genuinely liquid secondary market with real price discovery — but almost nobody in it publishes an official API.

Platform	What it gives you	API Access	Notes
StockX	The largest sneaker/streetwear resale marketplace with genuine bid/ask price discovery by size	PARTIAL / UNOFFICIAL	No official public API. Third-party scrapers (Apify actors, the open-source Sneaks-API Node.js wrapper on GitHub) cover StockX, GOAT, Flight Club, and Stadium Goods together — functional, but you're depending on unofficial access that can break when the site changes.
GOAT	StockX's main competitor — retail + resale pricing, "instant ship" premium data	PARTIAL / UNOFFICIAL	Same situation as StockX — Apify scrapers exist and compute the resale-minus-retail "premium" signal directly
SNKRDUNK	Japan's dominant sneaker/streetwear/trading-card resale marketplace — useful if you want APAC pricing alongside US/EU data	PARTIAL / UNOFFICIAL	Scraper-based access only, same as the above

This whole category runs on scraping. If you build here, budget for scraper maintenance (anti-bot measures change) rather than expecting the stability of a documented REST API.

5. Trading Cards & Sports Memorabilia

Sports cards, TCGs (Pokémon, Magic, etc.), and memorabilia — this category has matured further into real subscription APIs than sneakers has.

Platform	What it gives you	API Access	Notes
Card Ladder cardladder.com	Aggregates pricing from 14 sources including PWCC, eBay, MySlabs, Goldin, and Heritage; publishes market indexes, portfolio analytics, top-movers	REAL API	Genuinely has enterprise-tier API access for businesses/dealers — the most credible programmatic source in this category (\$150/yr for advanced individual tools)
Market Movers (Sports Card Investor) marketmoversapp.com	Tens of millions of sale comps back to 2001, real-time 24-hour "market movers" price-change tracking across 2M+ cards	PARTIAL / UNOFFICIAL	Consumer app first, from \$9.99/mo — check current terms if you need bulk/API-level access rather than in-app use
SportsCardsPro / PriceCharting	CSV price-list downloads per card set, plus a documented Prices API and Marketplace API	REAL API	Free tier exists (PriceCharting) — a good low-cost starting point before paying for Card Ladder
Card Hedge API api.cardhedger.com	Top movers, price trends, and market data across sports cards, TCGs (Pokémon, Magic, Yu-Gi-Oh, Lorcana, etc.), and pop-culture collectibles	REAL API	Publishes a full OpenAPI 3.0 spec and even an MCP endpoint for AI-agent integration — one of the more forward-looking APIs in this whole document
130point / PriceCharting (free tier)	Free, no-frills price lookups pulling from eBay sold listings	PARTIAL / UNOFFICIAL	Good enough for spot-checking Card Ladder's numbers without paying for two subscriptions

6. Fine Wine & Whisky

The one "weird collectible" category with a genuine institutional exchange behind it.

PLATFORM	WHAT IT GIVES YOU	API ACCESS	NOTES
Liv-ex (London International Vintners Exchange) liv-ex.com	The actual global exchange for fine wine — over 600 merchant members across 47 countries, accounting for an estimated 95% of fine wine trading globally. Publishes a documented Price Data API (v2): most-recent trade price, 30-day mean price, En Primeur release prices, keyed by LWIN wine-identifier codes. Also runs the Liv-ex Classification (a "wine version" of the Bordeaux 1855 Classification, rebuilt periodically from real trade data) and the Liv-ex 1000/100 indices.	REAL API	This is the real deal — Reuters and Bloomberg both cite Liv-ex data directly. Access is aimed at trade professionals (merchants, negociants) rather than retail, so expect a business relationship/onboarding process, not a self-serve signup.
Vinovest / Vint / Cult Wines	Retail investment platforms (full-bottle ownership or fractional collection shares) — covered in the collectibles PDF section already	NO API	Investment products, not data sources — though Vinovest and others likely reference Liv-ex pricing internally
Rare Whisky 101 / Apex 1000 Index	The closest whisky equivalent to Liv-ex — publishes indices tracking rare/collectible whisky auction and secondary prices	PARTIAL / UNOFFICIAL	Index/report-based rather than a live API; useful as a benchmark reference rather than a real-time feed

7. Classic Cars & Watches

PLATFORM	WHAT IT GIVES YOU	API ACCESS	NOTES
Hagerty Valuation Tools® hagerty.com/valuation-tools	The industry-standard classic car/truck/motorcycle valuation tool, searchable by make and model; also publishes the HAGI indices (HAGI Top Index ~+9% CAGR over 10 years)	PARTIAL / UNOFFICIAL	The web valuation tool is free to use directly; no documented public API for bulk/programmatic pricing has surfaced — worth reaching out to Hagerty commercially if you need this at scale
WatchCharts watchcharts.com	The leading luxury watch market-data index — WatchCharts Overall Index ran ~+12% CAGR from 2020–2024. No official public API, but an independent maintained REST wrapper exists that mirrors watchcharts.com data (watch directory, retail vs. market price trends, active/sold listings)	PARTIAL / UNOFFICIAL	The unofficial wrapper is genuinely functional (self-healing against site changes) but you're one step removed from an authoritative source — treat pricing as directional, not exact
Chrono24	The largest global watch marketplace by listing volume — real bid/ask style pricing across grey-market watch dealers	PARTIAL / UNOFFICIAL	Same story — third-party scrapers exist, no official developer API
Rally / Otis / Collectable	Fractional-ownership platforms for cars, watches, and memorabilia specifically	NO API	Investment products — see Section 12

8. Real Estate, Farmland & Timber Indices

PLATFORM	WHAT IT GIVES YOU	API ACCESS	NOTES
NCREIF (National Council of Real Estate Investment Fiduciaries) ncreif.org	The institutional benchmark for US real estate: NCREIF Property Index (NPI, back to 1977, 50,000+ properties), NCREIF Farmland Index (quarterly, back to 1990, ~\$16.1B market value across 1,023 properties as of Q4 2024, ~10.15% average annual return since 1992), and a Timberland index	PARTIAL / UNOFFICIAL	This is the real institutional benchmark data — but it's members-only. Non-members can inquire about subscription access; there's no open self-serve API.
Fundrise / Arrived / AcreTrader / FarmTogether	The actual retail investment platforms (eREITs, single-family rentals, farmland shares) covered in the first resource PDF	NO API	Investment products, not data feeds — useful to track their published deal-level return data manually as a sanity check against NCREIF benchmarks

9. Music & Royalty Income

PLATFORM	WHAT IT GIVES YOU	API ACCESS	NOTES
Royalty Exchange royaltyexchange.com	The largest royalty marketplace — 2,100+ music-rights assets listed, 22,500+ investors, auction-based pricing across music, film, patents, trademarks, and more. Marketplace multiples typically run 3-9x annual royalty income.	NO API	No public API found — but its published auction results function as a de facto pricing benchmark for royalty valuation even without programmatic access
SongVest	SEC Reg A+ issuer of fractional "SongShares" in specific hit catalogs (Queen, Taylor Swift, etc.)	NO API	Worth knowing this prices very differently from Royalty Exchange — SongVest offerings run 25-94x trailing royalty income (a "fan premium"), vs. Royalty Exchange's 3-9x market-clearing multiples. Not a data source, but a useful comparison point if you're modeling royalty valuations.
Chartmetric chartmetric.com	Not a royalty marketplace — a streaming/social analytics API (Spotify streams, playlist placements, social growth) that's the closest thing to a leading indicator for where a song's royalty income is headed	REAL API	The genuinely useful data layer here: pair Chartmetric's streaming-momentum data with Royalty Exchange's auction pricing to build an actual royalty-valuation signal

10. Carbon Credits & Environmental Markets

A genuine, fast-growing exchange-traded asset class (global market >\$1 trillion in 2025) — but split between institutional exchanges and analytics-layer APIs.

Platform	What it gives you	API Access	Notes
Xpansiv (CBL) xpansiv.com	The dominant global market infrastructure for carbon/environmental commodities — CBL spot exchange, Evolution Markets brokerage, and Xpansiv Connect™ portfolio management with transaction data feeds. Standardized GEO® spot contracts are the market's bellwether.	PARTIAL / UNOFFICIAL	Institutional infrastructure — the "real" venue, but access is via brokerage relationship, not self-serve API signup
AirCarbon Exchange (ACX)	A fully digital carbon exchange using blockchain/DLT architecture; supports spot and futures trading	PARTIAL / UNOFFICIAL	Built for large-volume compliance buyers with in-house carbon expertise, not a plug-and-play retail data feed
Sylvera Carbon Credit Analytics API	Independent carbon-credit rating and analytics data — project quality scoring layered on top of raw price data	REAL API	The most genuinely "developer-friendly" entry point in this category — worth demoing directly with Sylvera

11. Domain Names

Yes, genuinely investable — a real resale market with actual comparable-sales data.

PLATFORM	WHAT IT GIVES YOU	API ACCESS	NOTES
EstiBot estiobot.com	Bulk domain-name appraisal — appraises 2M+ domains per day, used by financial institutions and domain investors alike	REAL API	The most established automated domain-appraisal tool; supports portfolio-level bulk research
NameBio	Historical database of actual sold-domain transaction prices — the "comparable sales" layer that EstiBot's model-based valuations can be checked against	PARTIAL / UNOFFICIAL	Good pairing with EstiBot: real closed transactions vs. an algorithmic estimate
GoDaddy Auctions / Sedo / Dan.com	The actual live marketplaces where domains are bought and sold	NO API	Transaction venues, not data feeds

12. Fractional Collectibles Platforms — Context Only

Worth listing clearly since they came up in the last conversation, but none of these publish data APIs — they're closed-end investment products, not feeds.

- **Rally** — 21 collectible categories (classic cars, sports cards, comics, watches, wine, video games, art, fossils, premium domains, real estate), \$50 minimum, LLC-per-asset structure, secondary trading windows. Now under RSE Markets / part of the Public.com ecosystem.
- **Masterworks** — blue-chip contemporary art only, \$500 minimum, 29 verified exits at ~17% median IRR as of a May 2026 comparison.
- **Collectable** — fractional sports cards/memorabilia specifically.
- **Vinovest / Vint / Cult Wines** — wine and whisky (Section 6).

If your platform wants to *display* data about what these platforms hold or how their assets have performed, note that both Masterworks and Rally file with the SEC under Regulation A+ — their offering circulars and periodic filings (on EDGAR, same source covered in the first PDF) are the closest thing to a public data feed for their underlying performance, since neither exposes a developer API.

13. Reality Check: What's Actually Buildable

Being straight about the state of this landscape compared to mainstream financial data:

- **Genuinely strong, documented APIs exist for:** prediction markets (Kalshi, Polymarket), private-company pricing (Forge Data, Caplight), fine wine (Liv-ex), trading cards (Card Ladder, Card Hedge, SportsCardsPro), music-adjacent streaming data (Chartmetric), domain appraisal (EstiBot), and carbon-credit analytics (Sylvera).
- **Data exists but only through unofficial scrapers/wrappers:** sneakers (StockX/GOAT), watches (WatchCharts, Chrono24), classic cars (Hagerty's public tool has no bulk API). These work today but carry real maintenance risk — the underlying sites can change layout or add anti-bot protections at any time, breaking your pipeline without warning.
- **No data API at all — platform only:** most of the actual retail fractional-investment products (Rally, Masterworks, Fundrise, Arrived, AcreTrader, EquityZen, Hiive, Royalty Exchange, SongVest, Novig, Sporttrade). These are places to *transact*, not places to pull a feed from. The closest substitute for "data" on these is their own published deal results and — for the SEC-regulated ones — their Regulation A+ filings on EDGAR.
- **Members-only institutional data:** NCREIF (real estate/farmland/timber) and, to an extent, Xpansiv/CBL (carbon) — genuinely authoritative benchmarks, but gated behind institutional membership or brokerage relationships rather than a signup form.

14. Suggested Alt-Data Module Architecture

If you want to fold any of this into the master platform, it splits naturally into three tiers of integration effort:

- **Tier 1 — plug in directly (real APIs):** Kalshi + Polymarket (prediction markets), Forge Data or Caplight (pre-IPO pricing), Card Ladder or Card Hedge (trading cards), Chartmetric (music streaming momentum), EstiBot (domains). These can sit in the same normalized ingestion layer described in the first resource PDF.
- **Tier 2 — build a scraping/wrapper layer, budget for maintenance:** sneakers (StockX/GOAT via Apify or similar), watches (WatchCharts/Chrono24). Treat these the way you'd treat any scraped source — rate-limit respectfully, cache aggressively, and expect occasional breakage.
- **Tier 3 — track manually / via filings, no live feed:** Rally, Masterworks, Fundrise, Arrived, AcreTrader, Royalty Exchange, SongVest. For these, the most defensible "data" layer is pulling their Reg A+ / Reg D filings from SEC EDGAR (already in your ingestion stack from the first PDF) rather than trying to scrape their marketing sites.

Given how fragmented and immature the "alt-data API" layer is compared to mainstream financial data, this whole module is naturally a lower priority / later-phase build than the core equities-FX-crypto-commodities stack from the first resource PDF — but the pieces that *do* have real APIs (prediction markets especially) are genuinely production-ready today, not experimental.

Compiled from live web research, 29 July 2026. This is an unusually fast-moving and lightly regulated corner of the market — several platforms named here (especially in prediction markets and sports exchanges) are mid-lawsuit or mid-licensing-process as of this writing. Reconfirm current legal status and API terms directly with each provider before building anything transactional.
